L. Vandenberghe EE133A (Spring 2017)

17. IEEE floating point numbers

- floating point numbers with base 10
- floating point numbers with base 2
- IEEE floating point standard
- machine precision
- rounding error

Floating point numbers with base 10

$$x = \pm (.d_1 d_2 \dots d_n)_{10} \cdot 10^e$$

- $.d_1d_2...d_n$ is the mantissa $(d_i \text{ integer}, 0 \le d_i \le 9, d_1 \ne 0 \text{ if } x \ne 0)$
- *n* is the *mantissa length* (or *precision*)
- e is the exponent $(e_{\min} \le e \le e_{\max})$

Interpretation:
$$x = \pm (d_1 10^{-1} + d_2 10^{-2} + \dots + d_n 10^{-n}) \cdot 10^e$$

Example (with n = 6):

$$12.625 = +(.126250)_{10} \cdot 10^{2}$$

$$= +(1 \cdot 10^{-1} + 2 \cdot 10^{-2} + 6 \cdot 10^{-3} + 2 \cdot 10^{-4} + 5 \cdot 10^{-5} + 0 \cdot 10^{-6}) \cdot 10^{2}$$

used in pocket calculators

Properties

- a finite set of numbers
- unevenly spaced: distance between floating point numbers varies
 - the smallest number greater than 1 is $1 + 10^{-n+1}$
 - the smallest number greater than 10 is $10 + 10^{-n+2}$, ...
- largest positive number:

$$+(.999\cdots 9)_{10}\cdot 10^{e_{\text{max}}} = (1-10^{-n})10^{e_{\text{max}}}$$

• smallest positive number:

$$x_{\min} = +(.100\cdots 0)_{10}\cdot 10^{e_{\min}} = 10^{e_{\min}-1}$$

Floating point numbers with base 2

$$x = \pm (.d_1 d_2 \dots d_n)_2 \cdot 2^e$$

- $.d_1d_2...d_n$ is the *mantissa* $(d_i \in \{0,1\}, d_1 = 1 \text{ if } x \neq 0)$
- *n* is the *mantissa length* (or *precision*)
- e is the exponent $(e_{\min} \le e \le e_{\max})$

Interpretation:
$$x = \pm (d_1 2^{-1} + d_2 2^{-2} + \dots + d_n 2^{-n}) \cdot 2^e$$

Example (with n = 8):

$$12.625 = +(.11001010)_{2} \cdot 2^{4}$$

$$= +(1 \cdot 2^{-1} + 1 \cdot 2^{-2} + 0 \cdot 2^{-3} + 0 \cdot 2^{-4} + 1 \cdot 2^{-5} + 0 \cdot 2^{-6} + 1 \cdot 2^{-7} + 0 \cdot 2^{-8}) \cdot 2^{4}$$

used in almost all computers

Small example

we enumerate all positive floating point numbers for

$$n = 3, \qquad e_{\min} = -1, \qquad e_{\max} = 2$$

$$\begin{array}{lll} + (.100)_2 \cdot 2^{-1} &= 0.2500 \\ + (.101)_2 \cdot 2^{-1} &= 0.3125 \\ + (.110)_2 \cdot 2^{-1} &= 0.3750 \\ + (.111)_2 \cdot 2^{-1} &= 0.4375 \end{array} & \begin{array}{ll} + (.100)_2 \cdot 2^0 &= 0.500 \\ + (.101)_2 \cdot 2^0 &= 0.625 \\ + (.110)_2 \cdot 2^0 &= 0.750 \\ + (.111)_2 \cdot 2^{-1} &= 0.4375 \end{array} & \begin{array}{ll} + (.111)_2 \cdot 2^0 &= 0.500 \\ + (.111)_2 \cdot 2^0 &= 0.625 \\ + (.111)_2 \cdot 2^0 &= 0.750 \\ + (.111)_2 \cdot 2^0 &= 0.875 \end{array} \\ & \begin{array}{ll} + (.100)_2 \cdot 2^0 &= 0.500 \\ + (.111)_2 \cdot 2^0 &= 0.625 \\ + (.111)_2 \cdot 2^0 &= 0.750 \\ + (.111)_2 \cdot 2^0 &= 0.875 \end{array} \\ & \begin{array}{ll} + (.100)_2 \cdot 2^0 &= 0.500 \\ + (.111)_2 \cdot 2^0 &= 0.625 \\ + (.111)_2 \cdot 2^0 &= 0.750 \\ + (.111)_2 \cdot 2^0 &= 0.875 \end{array} \\ & \begin{array}{ll} + (.100)_2 \cdot 2^0 &= 0.625 \\ + (.111)_2 \cdot 2^0 &= 0.750 \\ + (.111)_2 \cdot 2^0 &= 0.875 \end{array} \\ & \begin{array}{ll} + (.100)_2 \cdot 2^0 &= 0.750 \\ + (.111)_2 \cdot 2^0 &= 0.875 \end{array} \\ & \begin{array}{ll} + (.100)_2 \cdot 2^0 &= 0.750 \\ + (.111)_2 \cdot 2^0 &= 0.875 \end{array} \\ & \begin{array}{ll} + (.100)_2 \cdot 2^0 &= 0.875 \\ + (.111)_2 \cdot 2^0 &= 0.875 \end{array} \\ & \begin{array}{ll} + (.100)_2 \cdot 2^0 &= 0.875 \\ + (.111)_2 \cdot 2^0 &= 0.875 \end{array} \\ & \begin{array}{ll} + (.100)_2 \cdot 2^0 &= 0.875 \\ + (.111)_2 \cdot 2^0 &= 0.875 \end{array} \\ & \begin{array}{ll} + (.100)_2 \cdot 2^0 &= 0.875 \\ + (.111)_2 \cdot 2^0 &= 0.875 \end{array} \\ & \begin{array}{ll} + (.100)_2 \cdot 2^0 &= 0.875 \\ + (.111)_2 \cdot 2^0 &= 0.875 \end{array} \\ & \begin{array}{ll} + (.100)_2 \cdot 2^0 &= 0.875 \\ + (.111)_2 \cdot 2^0 &= 0.875 \end{array} \\ & \begin{array}{ll} + (.100)_2 \cdot 2^0 &= 0.875 \\ + (.111)_2 \cdot 2^0 &= 0.875 \end{array} \\ & \begin{array}{ll} + (.100)_2 \cdot 2^0 &= 0.875 \\ + (.111)_2 \cdot 2^0 &= 0.875 \end{array} \\ & \begin{array}{ll} + (.100)_2 \cdot 2^0 &= 0.875 \\ + (.111)_2 \cdot 2^0 &= 0.875 \end{array} \\ & \begin{array}{ll} + (.100)_2 \cdot 2^0 &= 0.875 \\ + (.111)_2 \cdot 2^0 &= 0.875 \end{array} \\ & \begin{array}{ll} + (.100)_2 \cdot 2^0 &= 0.875 \\ + (.111)_2 \cdot 2^0 &= 0.875 \end{array} \\ & \begin{array}{ll} + (.100)_2 \cdot 2^0 &= 0.875 \\ + (.111)_2 \cdot 2^0 &= 0.875 \end{array} \\ & \begin{array}{ll} + (.100)_2 \cdot 2^0 &= 0.875 \\ + (.111)_2 \cdot 2^0 &= 0.875 \end{array} \\ & \begin{array}{ll} + (.100)_2 \cdot 2^0 &= 0.875 \\ + (.111)_2 \cdot 2^0 &= 0.875 \end{array} \\ & \begin{array}{ll} + (.100)_2 \cdot 2^0 &= 0.875 \\ + (.111)_2 \cdot 2^0 &= 0.875 \end{array} \\ & \begin{array}{ll} + (.100)_2 \cdot 2^0 &= 0.875 \\ + (.111)_2 \cdot 2^0 &= 0.875 \end{array} \\ \end{array}$$

Properties

for the floating point number system on page 17-4

- a finite set of unevenly spaced numbers
- the largest positive number is

$$x_{\text{max}} = +(.111 \cdots 1)_2 \cdot 2^{e_{\text{max}}} = (1 - 2^{-n})2^{e_{\text{max}}}$$

the smallest positive number is

$$x_{\min} = +(.100\cdots 0)_2 \cdot 2^{e_{\min}} = 2^{e_{\min}-1}$$

in practice, the number system includes 'subnormal' numbers

- unnormalized small numbers: $d_1 = 0$, $e = e_{\min}$
- includes the number 0

IEEE standard for binary arithmetic

specifies two binary floating point number formats

IEEE standard single precision

$$n = 24, \qquad e_{\min} = -125, \qquad e_{\max} = 128$$

requires 32 bits: 1 sign bit, 23 bits for mantissa, 8 bits for exponent

IEEE standard double precision

$$n = 53, \qquad e_{\min} = -1021, \qquad e_{\max} = 1024$$

requires 64 bits: 1 sign bit, 52 bits for mantissa, 11 bits for exponent

used in almost all modern computers

Machine precision

Machine precision (of the binary floating point number system on page 17-4)

$$\epsilon_M = 2^{-n}$$

n is the mantissa length

Example: IEEE standard double precision

$$n = 53, \qquad \epsilon_M = 2^{-53} \simeq 1.1102 \cdot 10^{-16}$$

Interpretation

 $1+2\epsilon_M$ is the smallest floating point number greater than 1:

$$(.10 \cdots 01)_2 \cdot 2^1 = 1 + 2^{1-n} = 1 + 2\epsilon_M$$

Rounding

- a floating-point number system is a finite set of numbers
- all other numbers must be rounded
- ullet we use the notation $\mathrm{fl}(x)$ for the floating-point representation of x

Rounding rules

- numbers are rounded to the nearest floating-point number
- ties are resolved by rounding to the number with least significant bit 0 ('round to nearest even')

Example: numbers $x \in (1, 1 + 2\epsilon_M)$ are rounded to 1 or $1 + 2\epsilon_M$

$$\mathrm{fl}(x)=1$$
 for $1 \leq x \leq 1+\epsilon_M$
$$\mathrm{fl}(x)=1+2\epsilon_M \quad \text{for } 1+\epsilon_M < x \leq 1+2\epsilon_M$$

therefore numbers between 1 and $1+\epsilon_M$ are indistinguishable from 1

Rounding error and machine precision

general bound on the rounding error:

$$\frac{|\operatorname{fl}(x) - x|}{|x|} \le \epsilon_M$$

- machine precision gives a bound on the relative error due to rounding
- number of correct (decimal) digits in f(x) is roughly

$$-\log_{10}\epsilon_M$$

i.e., about 15 or 16 in IEEE double precision

fundamental limit on accuracy of numerical computations

Exercises

Exercise 1: explain the following results in MATLAB

$$>> (1 + 2e-16) - 1$$
 ans = 2.2204e-16

$$>> (1 - 1e-16) - 1$$
 ans = $-1.1102e-16$

$$>> 1 + (1e-16 - 1)$$
 ans = 1.1102e-16

Exercise 2: run the following code in MATLAB and explain the result

```
x = 2;
for i=1:54
    x = sqrt(x);
end;
for i=1:54
    x = x^2;
end
```

Exercise 3: explain the following results $(\log(1+x)/x \approx 1 \text{ for small } x)$

```
>> log(1 + 3e-16) / 3e-16
ans = 0.7401
>> log(1 + 3e-16) / ((1 + 3e-16) - 1)
ans = 1.0000
```

Exercise 4: the function f(x) = 1 for $x \in [10^{-16}, 10^{-15}]$, evaluated as

$$((1 + x) - 1) / (1 + (x - 1))$$
